Sample Review Answers for Key Biology 30 Questions

Below are some common questions from Biology 30 exams along with detailed review answers to help you prepare effectively.

Question 1: Describe the structure and function of the mitochondria.

Review Answer:

The mitochondria are double-membraned organelles often referred to as the "powerhouses of the cell." They have an outer membrane that surrounds the organelle and a highly folded inner membrane called cristae, which increase the surface area. The primary function of mitochondria is to generate adenosine triphosphate (ATP) through cellular respiration. They play a crucial role in energy production by converting glucose and oxygen into ATP, water, and carbon dioxide. Mitochondria also contain their own DNA, allowing them to produce some of their own proteins independently of the nucleus.

Question 2: Explain the process of DNA replication.

Review Answer:

DNA replication is a semi-conservative process that occurs during the S phase of the cell cycle. It involves unwinding the double helix by the enzyme helicase, which separates the two strands. DNA polymerase then adds complementary nucleotides to each original strand, following base pairing rules (A with T, C with G). Leading strand synthesis is continuous, while lagging strand synthesis occurs in Okazaki fragments. DNA ligase joins these fragments to form a complete strand. The result is two identical DNA molecules, each consisting of one original and one new strand.

Question 3: What are Mendel's laws of inheritance?

Review Answer:

Mendel's laws include:

- Law of Segregation: During gamete formation, alleles for each gene separate so that each gamete carries only one allele for each gene.
- Law of Independent Assortment: Genes for different traits are inherited independently of each other, assuming they are on different chromosomes.
- Dominance and Recessiveness: In heterozygous individuals, the dominant allele masks the expression of the recessive allele.

These principles form the foundation for understanding inheritance patterns in genetics.
