Sample Questions and Model Responses

Question 1: A recipe calls for 2 cups of sugar for every 3 cups of flour. If you want to make a larger batch using 9 cups of flour, how much sugar will you need? Explain your reasoning.

Model Response:

To find out how much sugar is needed, I recognize that the ratio of sugar to flour is 2:3. Since the amount of flour increases from 3 cups to 9 cups, which is 3 times more, I multiply the sugar amount by the same factor:

- Original ratio: 2 cups sugar / 3 cups flour
- Scale factor: $9 \text{ cups flour} / 3 \text{ cups} = 3$
- Sugar needed: $2 \text{ cups} \times 3 = 6 \text{ cups}$

Answer: You will need 6 cups of sugar. I multiplied the original amount of sugar by 3 because the flour increased by a factor of 3, maintaining the same ratio.

Question 2: A store offers a 20% discount on a jacket that costs \$50. What is the sale price, and how did you find it?

Model Response:

First, I calculate 20% of \$50:

- $20\% = 0.20$
- Discount amount = $0.20 \$50 = \10

Then, subtract the discount from the original price:

- Sale price = $\$50 - \$10 = \$40$

Answer: The sale price of the jacket is \$40 because I calculated 20% of \$50 as \$10 and subtracted it from the original price.

Assessment and Grading Criteria

To ensure fairness and clarity, educators often use detailed rubrics for the Response Test:

- Understanding of Concepts (40%)
 - Correct identification of ratios, percentages, or relationships
