In-Depth Review of Key Concepts with Answers

1. Calculating Heat Transfer in Calorimetry

Question:

A 50.0 g sample of water is heated from 25°C to 75°C. How much heat energy is absorbed?
(Specific heat capacity of water = 4.18 J/g°C)

Answer:

Using the formula:

$$q = mc\Delta T$$

where:

- $m = 50.0 \text{ g}$
- $c = 4.18 \text{ J/g}^\circ\text{C}$
- $\Delta T = 75^\circ\text{C} - 25^\circ\text{C} = 50^\circ\text{C}$

Calculation:

$$q = 50.0 \text{ g} \times 4.18 \text{ J/g}^\circ\text{C} \times 50^\circ\text{C}$$

$$q = 50.0 \times 4.18 \times 50 = 10,450 \text{ J}$$

Result:

The water absorbs 10,450 Joules of heat energy.

2. Applying Hess's Law

Question:

Given the following reactions:

- $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$ ($\Delta H = -393.5 \text{ kJ}$)
- $\text{CO} + \frac{1}{2} \text{O}_2 \rightarrow \text{CO}_2$ ($\Delta H = -283 \text{ kJ}$)

Find ΔH for the reaction:

Answer:

Using Hess's Law, arrange the reactions to cancel out common terms:

From the second reaction:

Reversing it:

Now, add this to the first reaction:

Sum:

Simplify:

Total enthalpy change:

$$(-393.5 \text{ kJ} + 283 \text{ kJ} = -110.5 \text{ kJ})$$

Result:

$$\boxed{\Delta H = -110.5 \text{ kJ}} \text{ for the formation of CO from C and O}_2.$$

3. Bond Enthalpy Calculations

Question:

Calculate the approximate enthalpy change for the reaction:

$\text{CH}_4 + 2 \text{O}_2 \rightarrow \text{CO}_2 + 2 \text{H}_2\text{O}$, using bond enthalpies provided:

Bond	Enthalpy (kJ/mol)
C-H	412
C=O	799
O=O	498

Answer:

Step 1: Break all bonds in reactants:

- 4 C-H bonds: $4 \times 412 = 1648 \text{ kJ}$

- 2 O=O bonds: $2 \times 498 = 996 \text{ kJ}$

Total energy to break bonds: $1648 + 996 = 2644 \text{ kJ}$

Step 2: Form bonds in products:

- 2 C=O bonds in CO_2 : $2 \times 799 = 1598 \text{ kJ}$

- 4 O-H bonds in 2 H_2O molecules: $4 \times 463 = 1852 \text{ kJ}$ (assuming O-H bond enthalpy is 463 kJ/mol)

Total energy released: $1598 + 1852 = 3450 \text{ kJ}$

Step 3: Calculate ΔH :

$\Delta H \approx \text{Energy to break} - \text{Energy to form} = 2644 - 3450 = -805 \text{ kJ}$

Result:

Approximate enthalpy change for the reaction is -805 kJ (exothermic).

QuestionAnswer What is the main concept behind thermochemistry in Pearson Chemistry? Thermochemistry focuses on the study of heat changes that occur during chemical reactions and physical processes, emphasizing concepts like enthalpy, heat capacity, and calorimetry. How do you

calculate the enthalpy change for a reaction using Hess's Law? You add or subtract the known enthalpy changes of related reactions to find the overall enthalpy change for the target reaction, ensuring the reactions are combined appropriately to cancel out intermediates. What methods are commonly used to measure heat transfer in thermochemistry experiments? Calorimetry, particularly coffee cup and bomb calorimetry, are commonly used to measure heat transfer during chemical reactions by monitoring temperature changes in a controlled environment. How does bond enthalpy relate to the energy changes observed in thermochemistry? Bond enthalpy represents the energy required to break a specific bond in a molecule; differences in bond enthalpies between reactants and products help determine the overall enthalpy change of the reaction. What is the significance of standard enthalpy of formation in thermochemical calculations? Standard enthalpy of formation is the heat change when one mole of a compound forms from its elements in their standard states, serving as a reference point for calculating reaction enthalpies. How do endothermic and exothermic reactions differ in thermochemical terms? Endothermic reactions absorb heat from their surroundings, resulting in a positive enthalpy change, while exothermic reactions release heat, leading to a negative enthalpy change. What role does heat capacity play in calorimetry experiments? Heat capacity indicates how much heat is needed to raise the temperature of a substance by a certain amount; it's essential for calculating the heat transferred during reactions in calorimetry. How can you determine the enthalpy change of a reaction experimentally using calorimetry? By measuring the temperature change of a known quantity of reactants or products in a calorimeter and applying the heat capacity, you can calculate the heat transferred and thus the enthalpy change. Why is it important to consider the state (pressure, temperature) when discussing thermochemical data? Thermochemical data are state functions; the enthalpy change depends on the initial and final states. Consistency in pressure and temperature conditions ensures accurate and comparable measurements.
